**Studying nuclear reactions in the terminal stripper
of VERA: First results of $^{12}\text{C}(\text{p},\gamma)^{13}\text{N}$**

We want to discuss first results of a new type of experiment performed last week at VERA. $^{12}\text{C}^-$ ions are injected into the 3-MV tandem accelerator inducing nuclear reactions in the terminal stripper canal filled with H_2 gas. The radiative capture of protons in ^{12}C produce ^{13}N nuclei, which are identified on the high-energy end of the VERA AMS system. The preliminary results and possible implications on astrophysically relevant reactions such as $^{12}\text{C}(\text{p},\gamma)^{13}\text{N}$ and $^{13}\text{C}(\text{p},\gamma)^{14}\text{N}$ will be discussed.

Dienstag, 29. Juli 2003, 14 Uhr c.t.
