**Global Warming:
“Nature – Not Human Activity – Rules the Climate”**

The scientific evidence* clearly demonstrates that Carbon Dioxide contributes insignificantly to Global Warming and is therefore not a 'pollutant.' While CO₂ levels keep increasing, the climate has not warmed for the past decade and may even be cooling. Sea level continues to rise at the normal rate of 18 cm per century. These facts have not yet been widely recognized, and irrational GW fears continue to distort energy policies and foreign policy. All efforts to curtail CO₂ emissions, whether global, federal, or at the state level, are pointless -- and in any case, completely ineffective and very costly. Higher levels of CO₂ benefit both agriculture and forestry. On the whole, a warmer climate is beneficial for the national economy. On a time-scale of decades, changes in solar activity control the climate by modulating cosmic rays and thereby the degree of cloudiness of the atmosphere.
