**Applications of stable isotopes
in mass spectrometry**

Stable isotopes have become an indispensable tool for accurate absolute quantification and tracer studies in mass spectrometry. The presentation will cover applications of elemental speciation analysis and metabolomics, reflecting the state of the art of isotope dilution mass spectrometry addressing the complementary approaches, namely ICP-MS and ESI-MS based analysis (both in combination with chromatographic separation systems).

Analytical figures of merit of the different methods will be discussed with regard to isotope ratio measurement precision and – as a consequence – measurement uncertainty. The concept of *in vivo* synthesized isotopically enriched ^{34}S and ^{13}C standards will be highlighted.
